

CHANDRASHEKHAR WADIBHASME

Senior Software Engineer — Java / J2EE

shekharw2298@gmail.com | +91 9822882940 | linkedin.com/in/shekhar2298 | github.com/Shekhar2298

PROFESSIONAL SUMMARY

Senior Software Engineer with 5 years of experience designing and building backend systems in Java, Spring Boot and Microservices, with some full-stack work in React. Comfortable doing the low-level design for a feature — picking the right data structures and design patterns, and deciding where a flow should be asynchronous (using Kafka) versus synchronous — before writing, testing and shipping it. Have optimized and refactored existing services for performance — query tuning, indexing, caching lookups — not just built new ones from scratch. Used to working in Agile teams with QA, BAs and architects, and enjoy sharing what I've learned with teammates through code reviews and team discussions.

TECHNICAL SKILLS

Languages: Core Java (Java 8, Java 11), JavaScript

Backend & Frameworks: Spring Boot, Spring MVC, Spring Security, Spring AOP, Hibernate/JPA, Microservices, RESTful APIs

Frontend: React.js (Hooks, Components, React Router, Axios)

Design & Principles: Data Structures & Algorithms, SOLID Principles, DRY, Object-Oriented Programming (OOP), GoF Design Patterns (Factory, Singleton, Strategy, Builder, Observer), Low-Level Design

Testing: JUnit, Mockito, Integration Testing

Database: MySQL, PostgreSQL, SQL, Query Optimization, Indexing, Data Modelling

Cloud & DevOps: AWS, Kubernetes (Deployment, Service, Ingress), Terraform, Docker, Jenkins, GitHub Actions, CI/CD

AI-Assisted Development: GitHub Copilot (daily use for code generation, refactoring and review)

Tools: Git, Maven, Postman, Jira, Confluence, Eclipse

Other: Kafka, JWT Authentication, Role-Based Access Control (RBAC), Agile/Scrum, Code Reviews

PROFESSIONAL EXPERIENCE

Senior Full-Stack & DevOps Engineer — Ingenious Technohub Pvt. Ltd

Oct 2025 – Present

- Did the low-level design for the invoice screens and their REST APIs — decided how the React components and Spring Boot endpoints should be structured — after confirming the exact requirement with the BA and the client.
- Traced a slow invoice list (clients with thousands of invoices) to a linear scan over all records; fixed it with an indexed database query and a hash-map cache for recently viewed invoices, cutting load time noticeably.
- Added the active/inactive toggle feature — walked QA through the test scenarios beforehand, tested it locally and on the QA server, and only pushed to production once QA signed off.
- Noticed every developer was handling API errors differently, so proposed and built centralized exception handling with `@ControllerAdvice` — it's now the standard pattern for new services, and I review teammates' pull requests to keep it consistent.
- Wrote JUnit and Mockito tests plus a few integration tests for the invoice APIs, catching a couple of edge cases before QA even saw the build.
- That time invoice generation failed for one specific client in production — tracked it down with Postman, status codes and application logs, found a data-formatting bug just for that client, fixed it and added better logging so it would surface faster next time.
- Manage the AWS infrastructure with Terraform, run SonarQube checks before every merge, and maintain the Jenkins CI/CD pipeline that builds, tests and deploys both the React front end and Spring Boot backend.
- Designed and deployed an internal Academy Dashboard on Kubernetes (Deployment, Service, Ingress) with a React front end and Spring Boot backend, thinking through routing and scaling before writing the manifests.

Software Engineer & AI Training Dev — Neogen Softech

Apr 2023 – Jul 2024

- Built the soil-sample tracking backend as separate Java/Spring Boot microservices (registration, tracking, lab results); sat with the architect early on to decide how the services should split, before writing any code.
- Used Kafka to move sample-status updates between services asynchronously instead of chaining them with direct synchronous calls, so a slow lab-results service wouldn't block registration or tracking.

- Modelled each sample's status as a state machine (enum + allowed transitions) instead of scattering if/else checks across the code, so adding a new status later was a small, contained change.
- Applied SOLID principles and used Factory/Strategy design patterns so adding a new type of lab test later wouldn't mean rewriting existing logic.
- Wrote JUnit tests for each service and walked through test scenarios with QA before a release, especially edge cases like a result coming in for a sample that had already expired.

Associate Software Engineer — T & T Infra Ltd

Jan 2021 – Mar 2023

- Built ERP modules (fees, attendance, student records) in Java and Spring Boot, usually starting from a requirement note from the BA that I'd clarify with them before writing any code.
- Extended the fee module to support part-payments — tested it locally, handed QA a list of scenarios to check, and only deployed once they signed off.
- Rewrote a few slow attendance and fee-report queries — mostly missing indexes and unnecessary joins — which brought report generation time down noticeably.
- Secured the ERP's REST APIs with JWT login and role-based access so admin, staff and students could each see only what they were meant to.
- Handled bug reports by reproducing the issue, checking logs, and tracing it back to the exact piece of code — this is where I got comfortable reading stack traces under pressure.

KEY PROJECTS

Internal Academy Dashboard

Tech Stack: Java, Spring Boot, React.js, Kubernetes (Deployment, Service, Ingress), Jenkins

Internal admin panel for tracking employee course progress. After an early demo, HR flagged that any manager could see every team's data, not just their own — added role-based visibility so managers only see their own team, before it went further.

Bulk Invoice Generation & Dispatch System

Tech Stack: Java, Spring Boot, React.js, AWS, Terraform, Docker

Client invoicing system with a Spring Boot backend and a React front end. After the production bug where one client's invoice had bad data, added validation at the API layer for the fields that had caused it, and wrote integration tests around those checks so the same class of bug couldn't slip through again.

Soil Testing & Sample Tracking App

Tech Stack: Java, Spring Boot, Microservices, Kafka, MySQL

Agri-tech platform tracking a soil sample from farm to lab. Worked directly with the state agriculture department's team to line up our sample-status codes with their existing reporting system, so their dashboards didn't need any changes on their end.

Education ERP System

Tech Stack: Java, Spring Boot, MySQL, JWT, RBAC

Web-based ERP for a school/college. Migrated a few legacy fee-calculation scripts into proper Spring Boot services as part of modernising the ERP, which removed a manual month-end reconciliation step the finance team used to do by hand.

EDUCATION

Bachelor of Engineering (B.E.) — Sant Gadge Baba Amravati University

GPA: 8.30 / 10.00 | Aug 2016 – Nov 2020

CERTIFICATIONS

- AWS Cloud & DevOps Certification Program, Learnbay (Aug 2024 – Sep 2025) — AWS, Terraform, Docker, Kubernetes, Jenkins, GitHub Actions, CI/CD, Linux, Monitoring, Infrastructure as Code
- Full Stack Developer Certification, Generation India / Codecademy (2023)
- Agentic AI Certification (2026)
